

AMC1311x 高阻抗 2V 输入增强型隔离放大器

1 特性

- 2V 高阻抗输入电压范围，针对隔离式电压测量进行优化
- 低失调误差和温漂：
 - AMC1311B: $\pm 1.5\text{mV}$ (最大值), $\pm 15\mu\text{V}/^\circ\text{C}$ (最大值)
 - AMC1311: $\pm 9.9\text{mV}$ (最大值), $\pm 20\mu\text{V}/^\circ\text{C}$ (典型值)
- 固定增益: 1
- 极低增益误差和温漂：
 - AMC1311B: $\pm 0.3\%$ (最大值), $\pm 45\text{ppm}/^\circ\text{C}$ (最大值)
 - AMC1311: $\pm 1\%$ (最大值), $\pm 30\text{ppm}/^\circ\text{C}$ (典型值)
- 低非线性和温漂: 0.01%, 1ppm/ $^\circ\text{C}$ (典型值)
- 高侧 3.3V 运行电压 (AMC1311B)
- 高侧电源缺失指示
- 安全相关认证：
 - 符合 DIN V VDE V 0884-11 (VDE V 0884-11): 2017-01 标准的 7000 V_{PK} 增强型隔离
 - 符合 UL1577 标准且长达 1 分钟的 5000 V_{RMS} 隔离
 - CAN/CSA No. 5A 组件接受服务通知、IEC 60950-1 和 IEC 60065 终端设备标准

2 应用

- 可用于以下应用的隔离式电压检测：
 - 电机驱动器
 - 变频器
 - 不间断电源

3 说明

AMC1311 是一款隔离式精密放大器，此放大器的输出与输入电路由抗电磁干扰性能极强的隔离栅隔开。根据 VDE V 0884-11 和 UL1577 标准，该隔离栅经认证可提供高达 7kV_{PEAK} 的增强型电隔离。与隔离式电源结合使用时，该隔离放大器可将以不同共模电压电平运行的系统的各器件隔开，并防止较低电压器件损坏。

AMC1311 的高阻抗输入针对连接高压电阻分压器或具有高输出电阻的其他电压信号源的情况进行了优化。器件性能出色，支持在闭环系统中进行精确的低温漂电压或温度检测和控制。集成的高侧电源电压缺失检测功能可简化系统级设计和诊断。

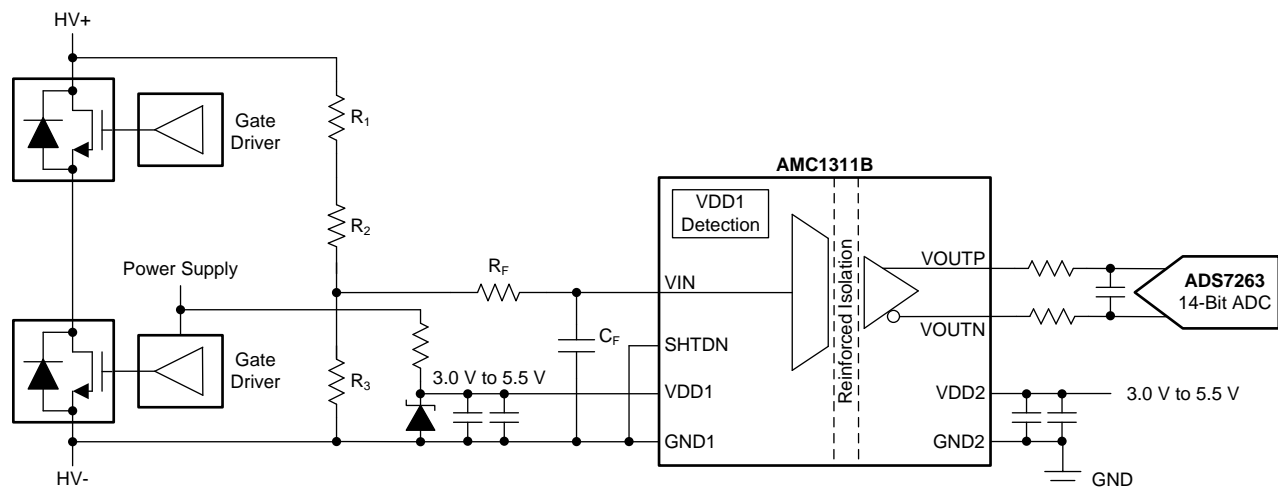

AMC1311 提供两种性能级别选项：AMC1311B 的额定扩展工业温度范围为 -55°C 至 $+125^\circ\text{C}$ ，AMC1311 为 -40°C 至 $+125^\circ\text{C}$ 。

器件信息⁽¹⁾

| 器件编号 | 封装 | 封装尺寸 (标称值) |
|----------|----------|-----------------|
| AMC1311x | SOIC (8) | 5.85mm x 7.50mm |

(1) 如需了解所有可用封装，请参阅产品说明书末尾的可订购产品附录。

6 Pin Configuration and Functions

Pin Functions

| PIN | | TYPE | DESCRIPTION |
|-----|-------|------|---|
| NO. | NAME | | |
| 1 | VDD1 | — | High-side power supply, 3.0 V to 5.5 V for the AMC1311B (4.5 V to 5.5 V for the AMC1311), relative to GND1. See the Power Supply Recommendations section for power-supply decoupling recommendations. |
| 2 | VIN | I | Analog input |
| 3 | SHTDN | I | Shutdown input, active high, with internal pullup resistor (typical value: 100 kΩ) |
| 4 | GND1 | — | High-side analog ground |
| 5 | GND2 | — | Low-side analog ground |
| 6 | VOUTN | O | Inverting analog output |
| 7 | VOUTP | O | Noninverting analog output |
| 8 | VDD2 | — | Low-side power supply, 3.0 V to 5.5 V, relative to GND2. See the Power Supply Recommendations section for power-supply decoupling recommendations. |

7 Specifications

7.1 Absolute Maximum Ratings⁽¹⁾

| | | MIN | MAX | UNIT |
|----------------------|--|------------|------------|------|
| Power-supply voltage | VDD1 to GND1 | −0.3 | 6.5 | V |
| | VDD2 to GND2 | −0.3 | 6.5 | |
| Input voltage | VIN | GND1 − 6 | VDD1 + 0.5 | V |
| | SHTDN | GND1 − 0.5 | VDD1 + 0.5 | |
| Output voltage | VOU _{TP} , VOU _{TN} | GND2 − 0.5 | VDD2 + 0.5 | V |
| Input current | Continuous, any pin except power-supply pins | −10 | 10 | mA |
| Temperature | Junction, T _J | | 150 | °C |
| | Storage, T _{stg} | −65 | 150 | |

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

7.2 ESD Ratings

| | | VALUE | UNIT |
|--|--|-------|------|
| V _(ESD) Electrostatic discharge | Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾ | ±2000 | V |
| | Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾ | ±1000 | |

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

over operating ambient temperature range (unless otherwise noted)

| | | MIN | NOM | MAX | UNIT |
|--|------------------------|------|-------|------|------|
| POWER SUPPLY | | | | | |
| High-side power supply | VDD1 to GND1, AMC1311 | 4.5 | 5 | 5.5 | V |
| | VDD1 to GND1, AMC1311B | 3.0 | 5 | 5.5 | |
| Low-side power supply | VDD2 to GND2 | 3.0 | 3.3 | 5.5 | V |
| ANALOG INPUT | | | | | |
| Absolute input voltage | VIN to GND1 | −2 | | VDD1 | V |
| V _{FSR} Specified linear input full-scale voltage | VIN to GND1 | −0.1 | | 2 | V |
| V _{Clipping} Input voltage before clipping output | VIN to GND1 | | 2.516 | | V |
| DIGITAL INPUT | | | | | |
| Input voltage | SHTDN | GND1 | | VDD1 | V |
| TEMPERATURE RANGE | | | | | |
| T _A Specified ambient temperature | AMC1311 | −40 | | 125 | °C |
| | AMC1311B | −55 | | 125 | |

7.4 Thermal Information

| THERMAL METRIC ⁽¹⁾ | | AMC1311x | UNIT |
|-------------------------------|--|------------|------|
| | | DWV (SOIC) | |
| | | 8 PINS | |
| $R_{\theta JA}$ | Junction-to-ambient thermal resistance | 84.6 | °C/W |
| $R_{\theta JC(top)}$ | Junction-to-case (top) thermal resistance | 28.3 | °C/W |
| $R_{\theta JB}$ | Junction-to-board thermal resistance | 41.1 | °C/W |
| Ψ_{JT} | Junction-to-top characterization parameter | 4.9 | °C/W |
| Ψ_{JB} | Junction-to-board characterization parameter | 39.1 | °C/W |
| $R_{\theta JC(bot)}$ | Junction-to-case (bottom) thermal resistance | N/A | °C/W |

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

7.5 Power Ratings

| PARAMETER | | TEST CONDITIONS | VALUE | UNIT |
|-----------|--|------------------------------------|-------|------|
| P_D | Maximum power dissipation (both sides) | VDD1 = VDD2 = 5.5 V | 97.9 | mW |
| | | VDD1 = VDD2 = 3.6 V, AMC1311B only | 56.16 | |
| P_{D1} | Maximum power dissipation (high-side supply) | VDD1 = 5.5 V | 53.35 | mW |
| | | VDD1 = 3.6 V, AMC1311B only | 30.24 | |
| P_{D2} | Maximum power dissipation (low-side supply) | VDD2 = 5.5 V | 44.55 | mW |
| | | VDD2 = 3.6 V | 25.92 | |

7.6 Insulation Specifications

over operating ambient temperature range (unless otherwise noted)

| PARAMETER | | TEST CONDITIONS | VALUE | UNIT |
|---|---|---|--------------------|------------------|
| GENERAL | | | | |
| CLR | External clearance ⁽¹⁾ | Shortest pin-to-pin distance through air | ≥ 9 | mm |
| CPG | External creepage ⁽¹⁾ | Shortest pin-to-pin distance across the package surface | ≥ 9 | mm |
| DTI | Distance through insulation | Minimum internal gap (internal clearance) of the double insulation (2 × 0.0105 mm) | ≥ 0.021 | mm |
| CTI | Comparative tracking index | DIN EN 60112 (VDE 0303-11); IEC 60112 | ≥ 600 | V |
| | Material group | According to IEC 60664-1 | I | |
| | Overvoltage category per IEC 60664-1 | Rated mains voltage ≤ 300 V _{RMS} | I-IV | |
| | | Rated mains voltage ≤ 600 V _{RMS} | I-IV | |
| | | Rated mains voltage ≤ 1000 V _{RMS} | I-III | |
| DIN V VDE V 0884-11 (VDE V 0884-11): 2017-01⁽²⁾ | | | | |
| V _{IORM} | Maximum repetitive peak isolation voltage | At ac voltage (bipolar) | 2121 | V _{PK} |
| V _{IOWM} | Maximum-rated isolation working voltage | At ac voltage (sine wave) | 1500 | V _{RMS} |
| | | At dc voltage | 2121 | V _{DC} |
| V _{IOTM} | Maximum transient isolation voltage | V _{TEST} = V _{IOTM} , t = 60 s (qualification test) | 7000 | V _{PK} |
| | | V _{TEST} = 1.2 × V _{IOTM} , t = 1 s (100% production test) | 8400 | |
| V _{IOSM} | Maximum surge isolation voltage ⁽³⁾ | Test method per IEC 60065, 1.2/50-μs waveform, V _{TEST} = 1.6 × V _{IOSM} = 12800 V _{PK} (qualification) | 8000 | V _{PK} |
| q _{pd} | Apparent charge ⁽⁴⁾ | Method a, after input/output safety test subgroup 2 / 3, V _{ini} = V _{IOTM} , t _{ini} = 60 s, V _{pd(m)} = 1.2 × V _{IORM} = 2545 V _{PK} , t _m = 10 s | ≤ 5 | pC |
| | | Method a, after environmental tests subgroup 1, V _{ini} = V _{IOTM} , t _{ini} = 60 s, V _{pd(m)} = 1.6 × V _{IORM} = 3394 V _{PK} , t _m = 10 s | ≤ 5 | |
| | | Method b1, at routine test (100% production) and preconditioning (type test), V _{ini} = V _{IOTM} , t _{ini} = 1 s, V _{pd(m)} = 1.875 × V _{IORM} = 3977 V _{PK} , t _m = 1 s | ≤ 5 | |
| C _{IO} | Barrier capacitance, input to output ⁽⁵⁾ | V _{IO} = 0.5 V _{PP} at 1 MHz | ~1 | pF |
| R _{IO} | Insulation resistance, input to output ⁽⁵⁾ | V _{IO} = 500 V at T _A = 25°C | > 10 ¹² | Ω |
| | | V _{IO} = 500 V at 100°C ≤ T _A ≤ 125°C | > 10 ¹¹ | |
| | | V _{IO} = 500 V at T _S = 150°C | > 10 ⁹ | |
| | Pollution degree | | 2 | |
| | Climatic category | | 55/125/21 | |
| UL1577 | | | | |
| V _{ISO} | Withstand isolation voltage | V _{TEST} = V _{ISO} = 5000 V _{RMS} or 7000 V _{DC} , t = 60 s (qualification), V _{TEST} = 1.2 × V _{ISO} = 6000 V _{RMS} , t = 1 s (100% production test) | 5000 | V _{RMS} |

- (1) Apply creepage and clearance requirements according to the specific equipment isolation standards of an application. Care must be taken to maintain the creepage and clearance distance of a board design to ensure that the mounting pads of the isolator on the printed circuit board (PCB) do not reduce this distance. Creepage and clearance on a PCB become equal in certain cases. Techniques such as inserting grooves and ribs on the PCB are used to help increase these specifications.
- (2) This coupler is suitable for *safe electrical insulation* only within the safety ratings. Compliance with the safety ratings shall be ensured by means of suitable protective circuits.
- (3) Testing is carried out in air or oil to determine the intrinsic surge immunity of the isolation barrier.
- (4) Apparent charge is electrical discharge caused by a partial discharge (pd).
- (5) All pins on each side of the barrier are tied together, creating a two-pin device.

7.7 Safety-Related Certifications

| VDE | UL |
|--|--|
| Certified according to DIN V VDE V 0884-11 (VDE V 0884-11): 2017-01, DIN EN 60950-1 (VDE 0805 Teil 1): 2014-08, and DIN EN 60065 (VDE 0860): 2005-11 | Recognized under 1577 component recognition and CSA component acceptance NO 5 programs |
| Reinforced insulation | Single protection |
| Certificate number: 40040142 | File number: E181974 |

7.8 Safety Limiting Values

Safety limiting intends to minimize potential damage to the isolation barrier upon failure of input or output (I/O) circuitry. A failure of the I/O may allow low resistance to ground or the supply and, without current limiting, dissipate sufficient power to overheat the die and damage the isolation barrier, potentially leading to secondary system failures.

| PARAMETER | TEST CONDITIONS | MIN TYP MAX | | | UNIT |
|--|---|-------------|--|------|------|
| | | | | | |
| I _S Safety input, output, or supply current | R _{θJA} = 84.6°C/W, T _J = 150°C, T _A = 25°C, VDD1 = VDD2 = 5.5 V, see 图 2 | | | 268 | mA |
| | R _{θJA} = 84.6°C/W, T _J = 150°C, T _A = 25°C, VDD1 = VDD2 = 3.6 V, AMC1311B only, see 图 2 | | | 410 | |
| P _S Safety input, output, or total power ⁽¹⁾ | R _{θJA} = 84.6°C/W, T _J = 150°C, T _A = 25°C, see 图 3 | | | 1477 | mW |
| T _S Maximum safety temperature | | | | 150 | °C |

(1) Input, output, or the sum of input and output power must not exceed this value.

The maximum safety temperature is the maximum junction temperature specified for the device. The power dissipation and junction-to-air thermal impedance of the device installed in the application hardware determines the junction temperature. The assumed junction-to-air thermal resistance in the [Thermal Information](#) table is that of a device installed on a high-K test board for leaded surface-mount packages. The power is the recommended maximum input voltage times the current. The junction temperature is then the ambient temperature plus the power times the junction-to-air thermal resistance.

7.9 Electrical Characteristics

minimum and maximum specifications of the AMC1311 apply from $T_A = -40^\circ\text{C}$ to $+125^\circ\text{C}$, $V_{DD1} = 4.5\text{ V}$ to 5.5 V , $V_{DD2} = 3.0\text{ V}$ to 5.5 V , $V_{IN} = -0.1\text{ V}$ to 2 V , and $\text{SHTDN} = \text{GND1} = 0\text{ V}$; minimum and maximum specifications of the AMC1311B apply from $T_A = -55^\circ\text{C}$ to $+125^\circ\text{C}$, $V_{DD1} = 3.0\text{ V}$ to 5.5 V , $V_{DD2} = 3.0\text{ V}$ to 5.5 V , $V_{IN} = -0.1\text{ V}$ to 2 V , and $\text{SHTDN} = \text{GND1} = 0\text{ V}$; typical specifications are at $T_A = 25^\circ\text{C}$, $V_{DD1} = 5\text{ V}$, and $V_{DD2} = 3.3\text{ V}$ (unless otherwise noted)

8 Detailed Description

8.1 Overview

The AMC1311 is a precision, isolated amplifier with a high input-impedance and wide input-voltage range. The input stage of the device drives a second-order, delta-sigma ($\Delta\Sigma$) modulator. The modulator uses the internal voltage reference and clock generator to convert the analog input signal to a digital bitstream. The drivers (termed TX in the *Functional Block Diagram* section) transfer the output of the modulator across the isolation barrier that separates the high-side and low-side voltage domains. The received bitstream and clock are synchronized and processed by a fourth-order analog filter on the low-side and presented as a differential analog output.

The SiO₂-based, double-capacitive isolation barrier supports a high level of magnetic field immunity, as described in *ISO72x Digital Isolator Magnetic-Field Immunity*. The digital modulation used in the AMC1311 and the isolation barrier characteristics result in high reliability and common-mode transient immunity.

8.2 Functional Block Diagram

8.3 Feature Description

8.3.1 Analog Input

The input stage of the AMC1311 feeds a second-order, switched-capacitor, feed-forward $\Delta\Sigma$ modulator. The modulator converts the analog signal into a bitstream that is transferred over the isolation barrier, as described in the *Isolation Channel Signal Transmission* section. The high-impedance, and low bias-current input of the AMC1311 makes the device suitable for isolated voltage sensing applications. Figure 45 depicts the equivalent input structure of the AMC1311 with the relevant components.

图 45. Equivalent Analog Input Circuit

There are two restrictions on the analog input signal, VIN. First, if the input voltage VIN exceeds the voltage of 6.5 V, the input current must be limited to 10 mA because the device input electrostatic discharge (ESD) protection turns on. In addition, the linearity and noise performance of the device are ensured only when the analog input voltage remains within the specified linear full-scale range (V_{FSR}).

Feature Description (接下页)

8.3.2 Isolation Channel Signal Transmission

The AMC1311 uses an on-off keying (OOK) modulation scheme to transmit the modulator output bitstream across the SiO₂-based isolation barrier. As shown in 图 46, the transmitter modulates the bitstream at TX IN with an internally-generated, high-frequency carrier across the isolation barrier to represent a digital *one* and does not send a signal to represent the digital *zero*. The nominal frequency of the carrier used inside the AMC1311 is 480 MHz.

The receiver demodulates the signal after advanced signal conditioning and produces the output. The AMC1311 also incorporates advanced circuit techniques to maximize the CMTI performance and minimize the radiated emissions caused by the high-frequency carrier and IO buffer switching.

图 46. Block Diagram of an Isolation Channel

图 47 shows the concept of the OOK scheme.

图 47. OOK-Based Modulation Scheme

Feature Description (接下页)

8.3.3 Fail-Safe Output

The AMC1311 offers a fail-safe output that simplifies diagnostics on system level. The fail-safe output is active in three cases:

- When the high-side supply VDD1 of the AMC1311 device is missing
- When the high-side supply VDD1 falls under the $VDD1_{UV}$ undervoltage threshold level or
- When the SHTDN pin is pulled high

图 48 shows the fail-safe output of the AMC1311 that is a negative differential output voltage that does not occur under normal device operation. As a reference value for the fail-safe detection on a system level, use the $V_{FAILSAFE}$ voltage as specified in the [Electrical Characteristics](#) table.

图 48. AMC1311 Output Behavior

8.4 Device Functional Modes

The AMC1311 is operational when the power supplies VDD1 and VDD2 are applied, as specified in the [Recommended Operating Conditions](#) table.

9 Application and Implementation

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The very low input bias current, ac and dc errors, and temperature drift make the AMC1311 a high-performance solution for industrial applications where voltage measurement with high common-mode levels is required.

9.2 Typical Application

Isolated amplifiers are widely used in frequency inverters that are critical parts of industrial motor drives, photovoltaic inverters, uninterruptible power supplies, and other industrial applications. The input structure of the AMC1311 is tailored for isolated voltage sensing using resistive dividers to reduce the high common-mode voltage.

图 49 depicts a typical use of the AMC1311 for dc bus voltage sensing in a frequency inverter application. Phase current measurement is accomplished through the shunt resistors, R_{SHUNT} (in this case, two-pin shunts) and the AMC1301 isolated amplifiers that are optimized for isolated current sensing. The high-impedance input and the high common-mode transient immunity of the AMC1311 ensure reliable and accurate operation even in high-noise environments, such as the power stage of frequency inverters as used in motor drives.

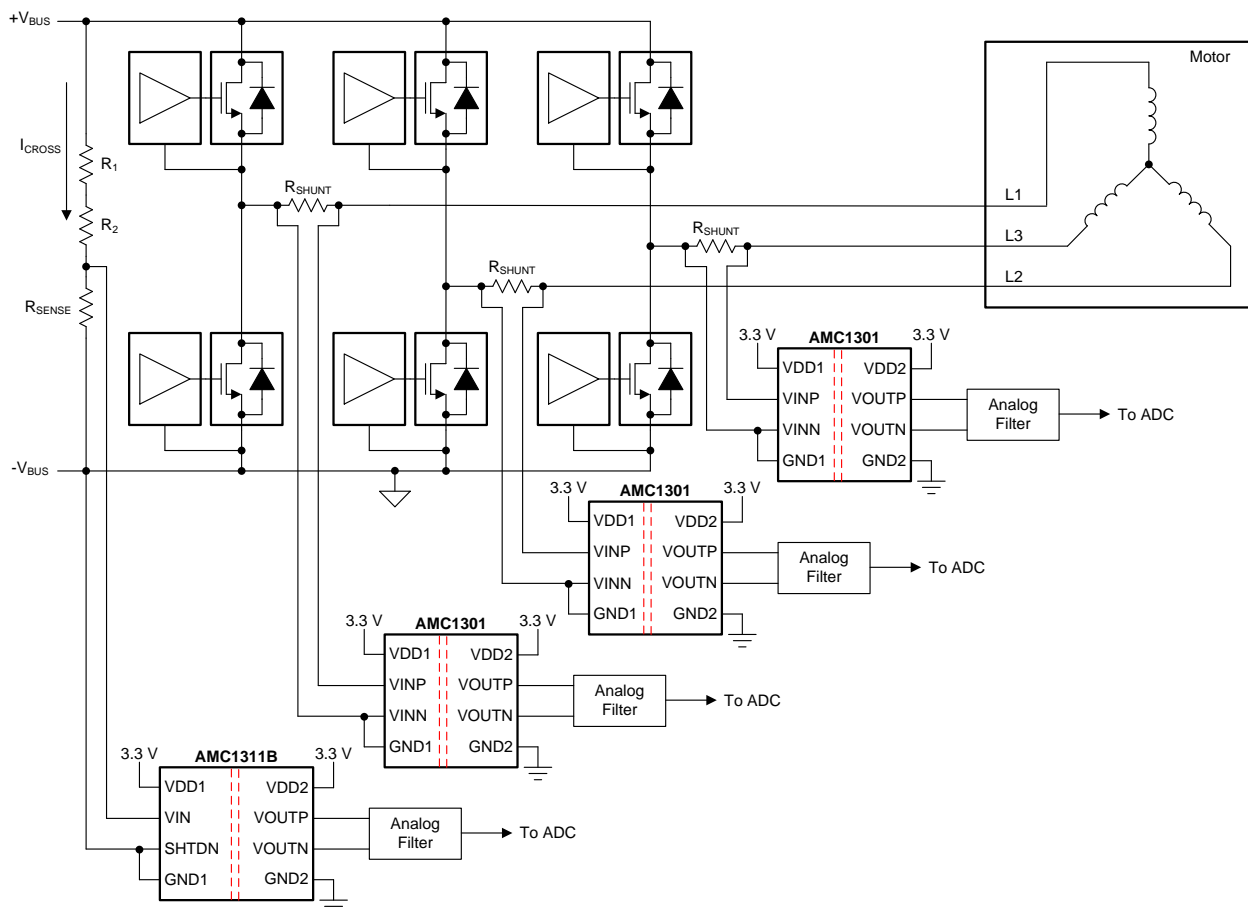

图 49. Using the AMC1311B for DC Bus Voltage Sensing in Frequency Inverters

Typical Application (接下页)

9.2.1 Design Requirements

表 1 lists the parameters for this typical application.

表 1. Design Requirements

| PARAMETER | VALUE |
|--|---------------------|
| High-side supply voltage | 3.3 V or 5 V |
| Low-side supply voltage | 3.3 V or 5 V |
| Voltage drop across the sensing resistor for a linear response | 2 V (maximum) |
| Current through the resistive divider, I_{CROSS} | 0.1 mA (maximum) |
| Signal delay (50% V_{IN} to 90% V_{OUTP} , V_{OUTN}) | 3 μ s (maximum) |

9.2.2 Detailed Design Procedure

Use Ohm's Law to calculate the minimum total resistance of the resistive divider to limit the cross current to the desired value ($R_{TOTAL} = V_{BUS} / I_{CROSS}$) and the required sense resistor value to be connected to the AMC1311 input: $R_{SENSE} = V_{FSR} / I_{CROSS}$.

Consider the following two restrictions to choose the proper value of the shunt resistor R_{SENSE} :

- The voltage drop on R_{SENSE} caused by the nominal voltage range of the system must not exceed the recommended input voltage range: $V_{SENSE} \leq V_{FSR}$
- The voltage drop on R_{SENSE} caused by the maximum allowed system overvoltage must not exceed the input voltage that causes a clipping output: $V_{SENSE} \leq V_{Clipping}$

表 2 lists examples of nominal E96-series (1% accuracy) resistor values for systems using 600 V and 800 V on the dc bus.

表 2. Resistor Value Examples

| PARAMETER | 600-V DC BUS | 800-V DC Bus |
|---|-----------------|-----------------|
| Resistive divider resistor R_1 | 3.01 M Ω | 4.22 M Ω |
| Resistive divider resistor R_2 | 3.01 M Ω | 4.22 M Ω |
| Sense resistor R_{SENSE} | 20 k Ω | 21 k Ω |
| Resulting current through resistive divider I_{CROSS} | 99.3 μ A | 94.5 μ A |
| Resulting voltage drop on sense resistor V_{SENSE} | 1.987 V | 1.986 V |

For systems using single-ended input ADCs, 图 50 shows an example of a TLV6001-based signal conversion and filter circuit as used on the AMC1311EVM. Tailor the bandwidth of this filter stage to the bandwidth requirement of the system and use NPO-type capacitors for best performance.

图 50. Connecting the AMC1311 Output to Single-Ended Input ADC

For more information on the general procedure to design the filtering and driving stages of SAR ADCs, see *18-Bit, 1MSPS Data Acquisition Block (DAQ) Optimized for Lowest Distortion and Noise* and *18-Bit Data Acquisition Block (DAQ) Optimized for Lowest Power*, available for download at www.ti.com.

9.2.3 Application Curve

In frequency inverter applications, the power switches must be protected in case of an overvoltage condition. To allow for fast system power-off, a low delay caused by the isolated amplifier is required. 图 51 shows the typical full-scale step response of the AMC1311. Consider the delay of the required window comparator and the MCU to calculate the overall response time of the system.

图 51. Step Response of the AMC1311B

9.3 Do's and Don'ts

Do not leave the analog input VIN of the AMC1311 unconnected (floating) when the device is powered up on the high-side. If the device input is left floating, the bias current may generate a negative input voltage that exceeds the specified input voltage range and the output of the device is invalid.

10 Power Supply Recommendations

In a typical frequency inverter application, the high-side power supply (VDD1) for the AMC1311 is generated from the low-side supply (VDD2) of the device by an isolated dc/dc converter circuit. A low-cost solution is based on the push-pull driver SN6501 and a transformer that supports the desired isolation voltage ratings. TI recommends using a low-ESR decoupling capacitor of 0.1 μF and an additional capacitor of minimum 1 μF for both supplies of the AMC1311. Place these decoupling capacitors as close as possible to the AMC1311 power-supply pins to minimize supply current loops and electromagnetic emissions.

The AMC1311 does not require any specific power up sequencing. Consider the analog settling time t_{AS} as specified in the [Switching Characteristics](#) table after ramp up of the VDD1 high-side supply.

图 52. SN6501-Based, High-Side Power Supply

11 Layout

11.1 Layout Guidelines

For best performance, place the smaller 0.1- μF decoupling capacitors (C1 and C6) as close as possible to the AMC1311 power-supply pins, followed by the additional C2 and C5 capacitors with a minimum value of 1 μF . The resistors and capacitors used for the analog input (C3) and output filters (R5, R10, and C13) are placed next to the decoupling capacitors. Use 1206-size, SMD-type, ceramic decoupling capacitors and route the traces to the VIN and SHTDN pins underneath. Connect the supply voltage sources in a way that allows the supply current to flow through the pads of the decoupling capacitors before powering the AMC1311.

图 53 shows this approach as implemented on the [AMC1311EVM](#). Capacitors C5 and C6 decouple the high-side supply VDD1 while capacitors C1 and C2 are used to support the low-side supply VDD2 of the AMC1311.

| AMC1311DWVR | ACTIVE | SOIC | DWV | 8 | 1000 | RoHS & Green | NIPDAU | Level-3-260C-168 HR | -40 to 125 | 1311 | Samples |

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) **MSL, Peak Temp.** - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) **Lead finish/Ball material** - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
